

# NORMAN SHARK

## The Chinese Malware Complexes: The Maudi Surveillance Operation

Snorre Fagerland, Principal Security Researcher

## Introduction

Maudi is a series of small malwares that share similar configuration and behaviour. The naming of this family has not been very established, but some samples are detected by some vendors as Maudi or PoisonIvy. This is partly accurate as Maudi trojans in almost all cases install the well known PoisonIvy remote access trojan.

These malwares are not particularly new - they have been in circulation for a long time, probably going back to at least 2009. Still, they provide a backdrop to other attacks that is interesting.

## Behaviour

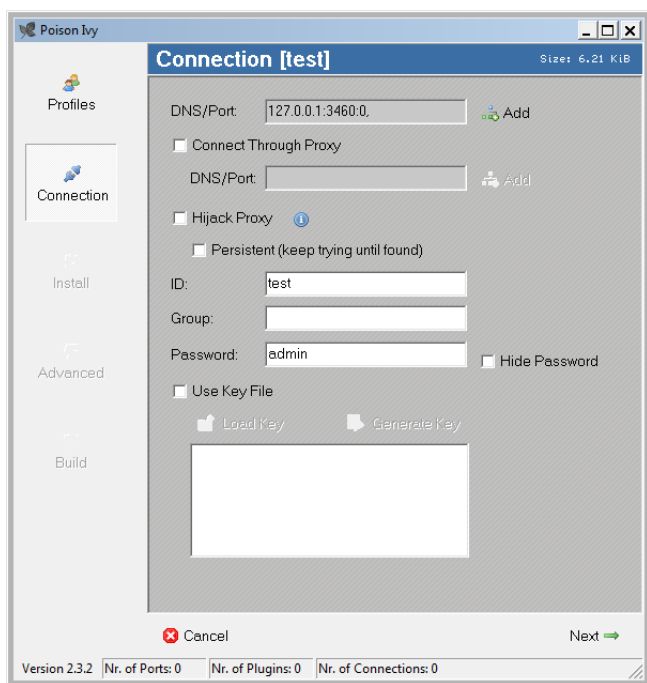

The malware itself is not very complex. These are small installers that create two files – one library (typically called `msacm32.drv`, `ntshrui.dll` or `wdmaud.drv`) in the Windows folder, and a raw PoisonIvy shellcode blob called `user.dat`, `user.db`, `temp.db` or something along those lines. The installer then spawns `explorer.exe`, which then automatically loads the malicious library through a mechanism called *DLL hijacking aka DLL preloading* (1). There are innocent libraries with the same names in the Windows System folder, but since the malicious libraries are placed in the Windows folder, they sneak in the queue and Explorer loads them first.

The malicious library then reads and directly calls the PoisonIvy code in `user.dat`, which establishes an encrypted communication with the configured C&C server.

When communication is established, the attacker has unauthorized access to the computer.

## Configuration

PoisonIvy code blobs are preconfigured in the PoisonIvy builder program to contain information about which Command & Control server to contact, which port to establish connection on, and various other parameters.

### The PoisonIvy builder

The *Maudi* PoisonIvy droppers contain their own small xor-encoded configuration block which overrides the default settings stored in the PoisonIvy blob. This usually contains the name of the C&C server, port and what corresponds to the PoisonIvy profile ID.

Example Maudi configuration:

```
EA 7A 56 56 E4 7A 56 56 | 56 56 56 56 78 66 69 73  êz00áz000000xfis
68 00 31 37 31 30 38 38 | 30 34 36 2E 67 6E 77 61  h 171088046.gnwa
79 2E 6F 72 67 00 00 00 | 00 00 00 00 00 00 00 00  y.org
00 00 00 00 00 00 00 00 | 00 00 00 00 00 00 00 00
00 00 00 00 84 0D 00 00 | BF 32 E2 51 6C 52 66 1B  "P ¿2âQ1Rf←
```

Profile ID: xfish

C&C: 171088046.gnway.org

port: 0x0D84 = 3460

The ID *xfish* is used in many of these malwares and may be a default value, but there are many others in use.

PoisonIvy uses the Camellia 256-bit block cipher for its encrypted communication. The password for this communication is usually hardcoded in the malware itself; the default value used by the builder is “admin”.

The passwords used by Maudi droppers vary. Sometimes the default value is used, other times the password is set to longer strings. There seems to be an affinity for passwords of length 11 (0x0b). A few are shown below.

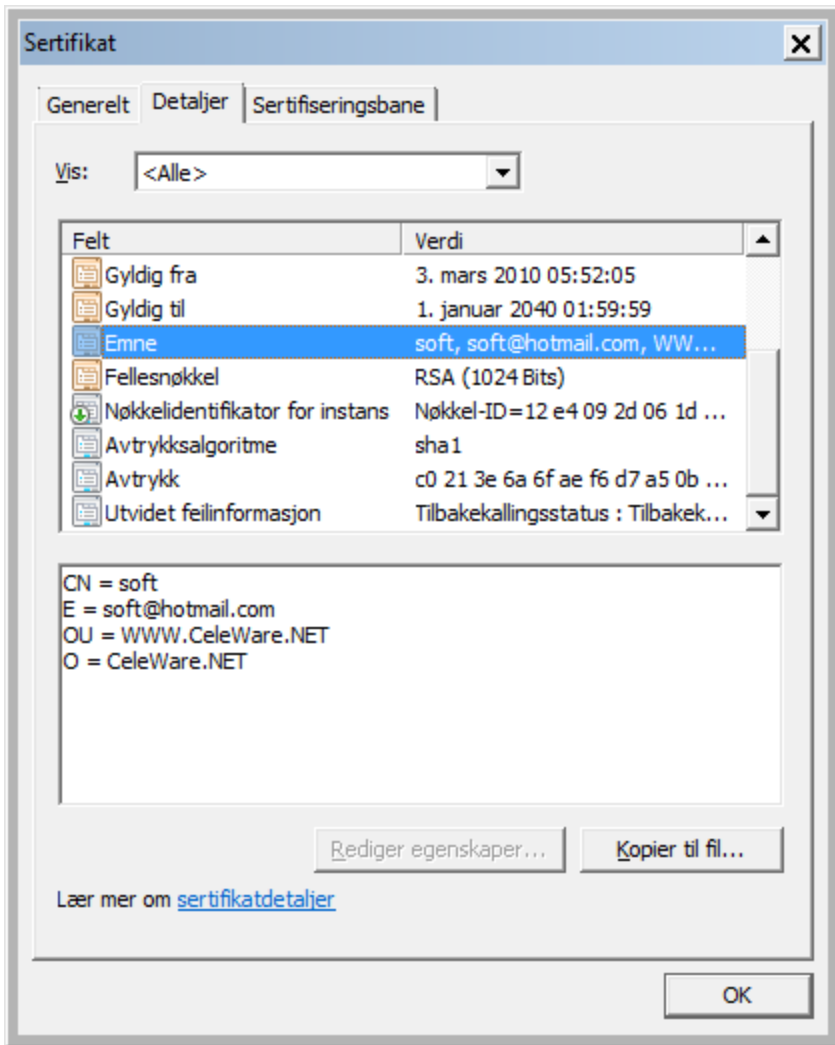

20110105110
12345678901
beijing2011
41232619820
20110228001
20110000000
11111111111

*Some Maudi-PoisonIvy server passwords*

## Certificates

The interesting bit with these trojans is that practically all of them are digitally signed using self-made test certificates. These certificates vary somewhat, but most contain the recognizable string “WWW.CeleWare.NET” or “WWW.AeleWare.NET” in their Organizational Unit (OU) section. The CeleWare strings are default values left by the free code signing tool CeleSign.exe from *Yonsm.NET*.

Though the tool itself seems innocent enough, many files signed by it are malicious.

There were a number of different such certificates, and it may be that the varying certificates denote different campaigns, projects or other contexts – for example, all samples we have seen signed “DataBase@Hotmail.com” are droppers that install Maudi components signed “MogolSoft@Hotmail.com” or “SoftSign@HotMail.com”.

*Stolen certificates*

Though by far most of these malwares use test certificates, not all follow this pattern. A few are not signed at all, and in two cases we have seen the use of a stolen certificate.

The certificate in question belongs to **YNK Japan Inc.**

```
0000000000: 78 66 69 73 68 00 00 00 | 00 00 00 00 70 2E 68 61 xfish p.ha
0000000010: 6E 6E 6D 61 69 6C 6C 2E | 6E 65 74 00 00 00 00 00 nnmaill.net
0000000020: 00 00 00 00 00 00 00 00 | 00 00 00 00 00 00 00 00
0000000030: 00 00 00 00 00 00 00 00 | 00 00 00 00 00 00 84 0D "P
```

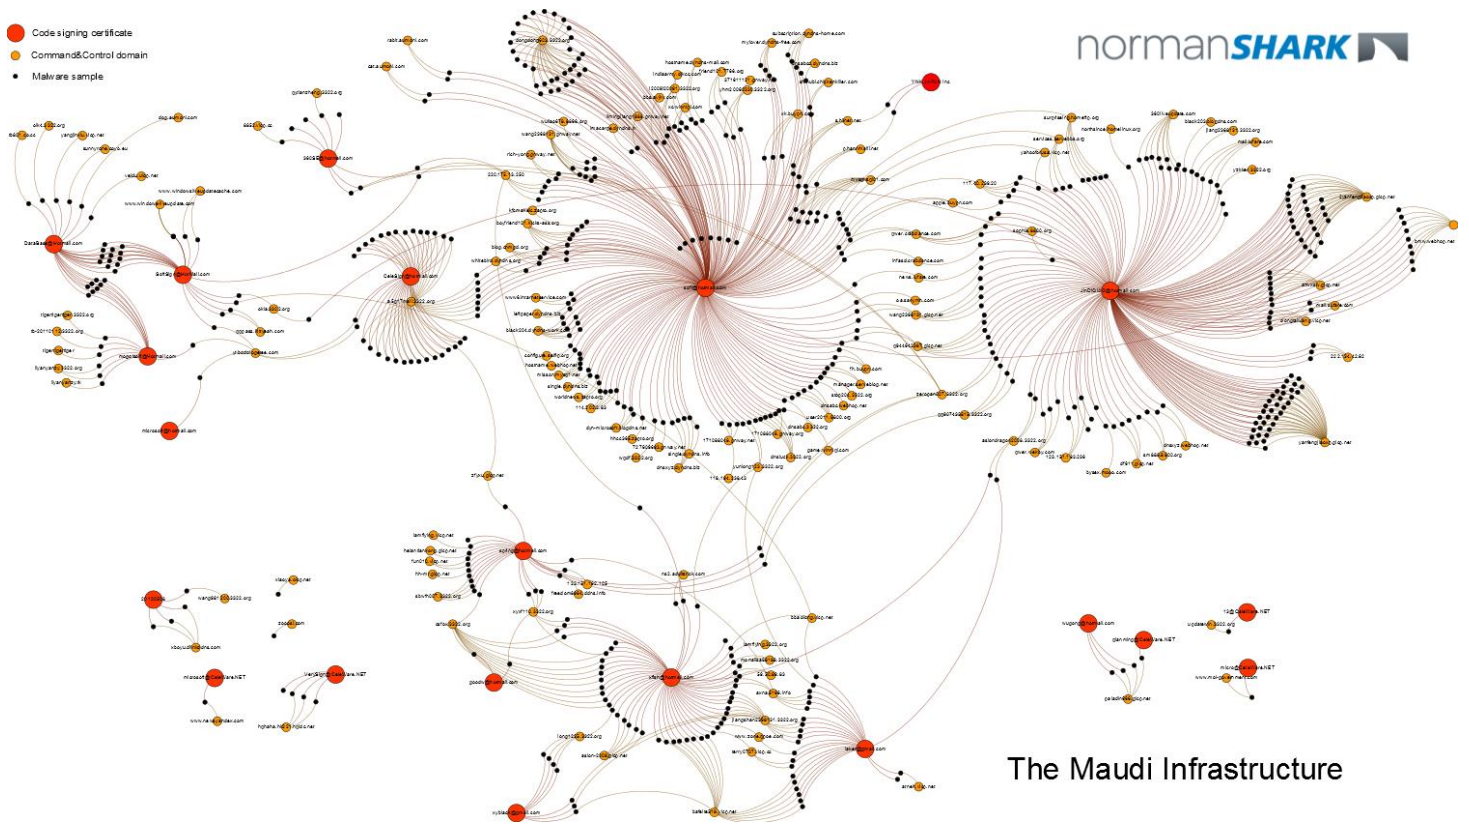

This is the configuration block from one of the YNK-signed Maudi samples. C&C is **p.hannmaill.net**, port is **3460 (0xD84)**, and tag is **xfish**.

These two trojans are configured to connect to *p.hannmaill.net* and *s.hiinet.net*, respectively. These domains appear registered by the same entity (*sofoxman@gmail.com*).

Both the domains and the certificate have been connected to targeted attack campaigns before.

# Infrastructure

By combining certificates and command&control infrastructure we can construct a partial image of this malware operation

*Note: A high-resolution version of this graphic is appended to this report.*

In this diagram the samples are organized in clusters signed similarly. What quickly becomes obvious is that most of the samples are connected; either they use the same certificate, or their certificate cluster is connected with other clusters through common Command&Control servers. Some clusters (shown at the lower right and left side) seem unconnected beyond the fact that they use the same malware.

The Command&Control servers used are in many cases organized through well-known dynamic DNS providers such as 3322.org, zipto.org and so on, but there are also a few seemingly directly registered second level domains. A full list of these is provided in the appendix.

## Targeting

### *Local Chinese interests and human rights activists*

We do not have extensive data on which targets have been exposed to Maudi malware, but we have some examples which give decent hints. Some Maudi droppers display images, like the ones below:

*This picture was widely distributed in 2009, and allegedly showed results of violence during an Uighur riot. However, it was later reported to be taken from a car accident.*

*This picture from Xinhuanet is reportedly from the 2008 riots in Lhasa, Tibet.*

These are classic examples of decoys used in targeted campaigns against activists working for the rights of ethnic minorities within the Chinese borders.

Other decoy documents contain small messages in Chinese; and Chinese name listings.

This gives the general impression that this family is used mostly against domestic Chinese targets and human rights activists. Other research has confirmed this impression. In his 2010 article “Human Rights and Malware Attacks” (2), security researcher Nart Villeneuve documents the use of Maudi as the downloaded payload of spearphishing attacks.

The initial payload in that case was a mail attachment, an exploited PDF file (readme.pdf, md5 72bdca7dd12ed04b21dfa60c5c2ab6c4) which downloaded and decoded an encoded blob (md5 ec16143a14c091100e7af30de03fce1f) from the site *www.humanright-watch.org*, not to be confused with the legitimate Human Rights’ Watch website *hrw.org*.

The decoded file was a Maudi dropper, self-signed using the name “soft@hotmail.com”, and the dropped component belonged to the “JinDiQIAO@hotmail.com”-signed cluster.

### *Mongolia*

There are hints at other targets as well. A group of Maudis use domain names and other strings that seem to indicate a focus on a specific region, namely **Mongolia**.

Mongolia is an interesting country. It is democratic with a multi-party system, and has a market-driven economy. It is squeezed between two very powerful nations – Russia to the North and China to the South. It is also a country rich on geological natural resources.

The initial hints about this targeting are vague. Some of the Maudi samples are signed using self-signed certificate issued to “mogolsoft@hotmail.com”. Others use the Command & Control domain “mol-goverment.com”. This domain was registered by a known targeted attack actor, *hlemonk@163.com*, who has registered a string of other malware-connected domains – among others *goodmongol.com*.

However, when looking more closely, more solid ties to Mongolian targets can be found. The Maudi domain *bodologetee.com* (registered by the email entity *mongolianews@yahoo.com*) can be documented used in other attacks on apparent Mongolian targets.

For example, the malware dropper cc1a806d25982acdb35dd196ab8171bc, a WinRAR SFX executable installed through the use of the Word exploit CVE-2012-0158, contained a PlugX component configured to connect to *ppt.bodologetee.com*. This is documented in the Norman Shark blog post “***The Chinese Malware Complexes: PlugX Used against Mongolian Targets***”. (3)

## Connections to other attacks

Indirectly, we see that the Maudi infrastructure shares parameters with several well known targeted attack campaigns.

### ○ **qwer.wekby.com - domain**

Three samples connect to *qwer.wekby.com*, known from the RSA breach in 2011 (4). These samples are (md5, profile ID):

```
28b5241ca13603636dbf626792231161, qwerw
6a83dc3f53079e17ecc49cbc0dacc8f5, qwerw
cf45dbdb3718b4b728c2dd894032464b, qwerw
```

The malwares used in the RSA intrusion itself were also PoisonIvy, though used a different dropper mechanism and were signed using a different digital certificate.

### ○ **jeno\_1980@hotmail.com – domain registration**

Two samples connect to *ns2.adultstick.com*. This domain was registered by *jeno\_1980@hotmail.com*, an email address also used to register domains used both in the Mirage (5) and Sin Digo (6) malware campaigns.

```
7d36ad6aafb1f9496ccc6ac1a8bb57e, Irqdz
64718689ee3ff695c55ea1ec213434d1, Irqdz
```

### ○ **enbtcd@yahoo.com.co – domain registration**

Some Maudi samples connect to *windows-liveupdate.com* or *windowsliveupdatecache.com*, domains registered by the entity *enbtcd@yahoo.com.co*. This address has also registered domains used in Briba (aka c0d0so0) malware, which has been used for many targeted attacks.

```
bd9a1fbd76c00015a59a3b5c93d4030e, zwdb
c64aab79e5107fc8ffd4699288c2e3be, gzxx
c9f33d544c5657d4ba55a92e06e38d06, Qbxt
49c7cae0fda8e5089e993a169c6c4197, krgqy
914fdaf7aa098ac00067a2b265fc91da, qq
```

### ○ hlemonk@163.com - domain registration

This address was used to register the Maudi domains mol-government.com and newsyandex.com, used to host C&C for these samples:

```
c93f8a7a899142db1e92138b76407588
227636fb88e19eca33a02cbb46f279fb
6e88c39c270e259c4472f6eceb8a241f
865fec48937686c2d0708847f30b1264
c07e857d2602d2a813fd23d711871571
a25e5bcc52c386eb046149799ed81b2b
3563c21cf5c46e8e39f17e733c2b9b1e, h511b0
e78d39d1862338e4c711238223618e44, h511b0
```

This registrant has also registered a great deal of other dodgy domains. Mol-government.com and these other domains have been used as C&C by Sogu/Thoper trojans in attacks on apparent Korean and Mongolian targets, as well as by other malwares like PcClient.

### ○ yt.bodologetee.com – domain

This domain has been used as Command & Control domain for a number of samples. It has also been documented used by PlugX malware in campaigns apparently against Mongolian targets (3). The same registration information was used to register yahoomesseges.com, which has been used by EvilGrab (7) malware.

```

ef404a76bd11e1d675b7686775ed7f1c, nsc01
```

### ○ YNK JAPAN Inc – digital certificate

As previously mentioned, two samples were digitally signed using a certificate belonging to YNK JAPAN Inc.; a subsidiary of a Korean game producer. This certificate has been used in several hundred samples spanning various campaigns and incidents. One of these was the SK intrusion (8) in 2011, where one of the initial malwares - a Sogu/Thoper trojan - was signed with it.

```

c3d14ee0bd01ebc9e5844578babe462f, xfish
```

## Conclusion

The Maudi malware family seems to have been mostly used against Chinese/South-East Asian targets. However, it shares some indicators (C&C domains, registration information) with other, more high-profile attacks.

What these connections mean is unclear. It might be just sharing of information between groups; we know that there is quite a bit of sharing going on, particularly of malware and source code. Less is known about how much is shared in terms of infrastructure (ex. domains).

It is our opinion, however, that the Maudi system hints at something else. There is for example a large amount of samples that use the same self-signed certificates in addition to overlaps in other indicators. Self-signed certificates have little value in the underground as they can be freely made; so there is little reason for sharing these. Instead the impression is that these malwares have been signed by the same malware creation system.

Another aspect is the architecture where default PoisonIvy shellcode blobs are overridden with configuration information from the dropper. This also may indicate homegrown build tools, possibly to alleviate language issues with the PoisonIvy builder itself.

There is a possibility that this indicates a large group of attackers, but might also be a part of a Digital Quartermaster function, as recently postulated by FireEye (9).
